

OK-Braze Consulting

Companies are facing tremendous economic pressure today which requires them to place additional focus on their core business.

This fact led OKTED to add Consulting Services to its portfolio of products. OKTED has a team of professionals with expertise in a variety of brazing applications.

Through frequent on-site visits, our Brazing Application Engineers can help diagnose and resolve operational issues and support your brazing processes. Our Brazing Application Engineers have access to internal laboratory capabilities for sample testing and analysis.

Brazing Audits

The brazing audit process is a service that OKTED offers to assist in optimizing your company's brazing operation. The process examines a customer's entire material joining operation by a member of our Technical Service team. Upon completion of the audit, a written report is furnished offering recommendations and other cost savings options.

Engineering Assistance

Our technical support staff assists customers in solving their brazing and soldering problems by recommending appropriate alloys and offering alternatives for their applications. This is accomplished through test brazing of customer components, examination of previously brazed assemblies, and through feasibility studies which explore the options available and the benefits associated with the proposed solutions.
